

The New Foundation for Smart Warehouses Is Intelligence

Why Warehouses Need New Technology

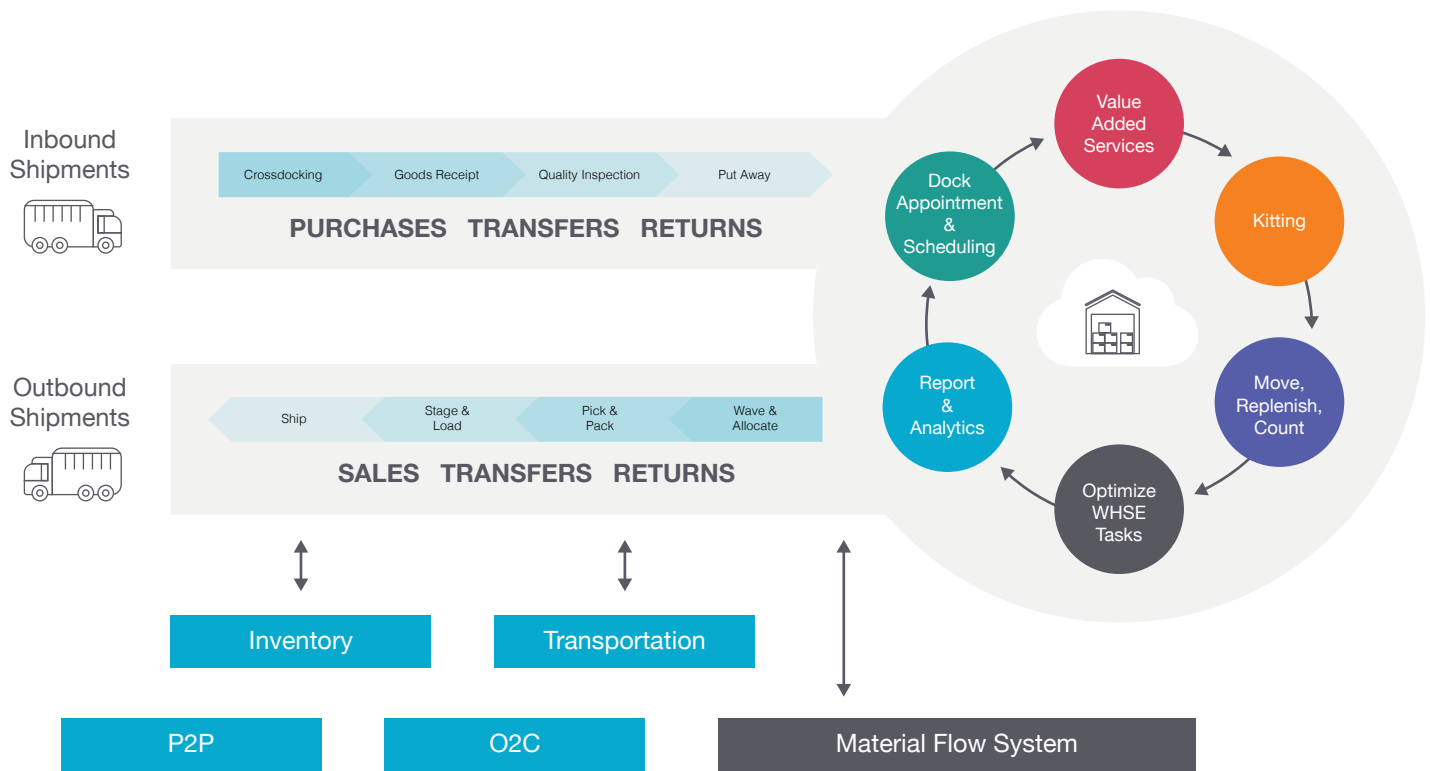

The on-demand global economy requires the efficient movement of goods, ingredients and supplies to fulfill the expanding ecommerce environment. It often is a complex challenge to adapt current processes for multiple priorities from compliance to reacting to customer demands. The modern warehouse requires new technology to manage more than inventory to ensure stock availability, service fulfillment and the resources to deliver on time at a competitive cost.

SAP Extended Warehouse Management (EWM) offers visibility for better accountability and tracking of products from origin to destination. It integrates with other SAP modules such as Transportation Management and ERP to enable greater reporting and analysis in a real-time environment. The result is the ability to remain agile and make critical decisions to troubleshoot issues and take advantage of new opportunities by:

- Increasing efficiency & productivity
- Reducing inventory & labor costs
- Enabling process automation & scalability
- Improving real-time decision making
- Staying compliant

You can also extend synchronization further through the creation of an intelligent enterprise that is integrated with SAP Advanced Track & Trace for Pharmaceuticals (ATTP). The information is then shared across all stakeholders in the digital supply chain.

Intelligence Through Integration

The integrated functionality of smart warehouses include components to manage:

- Labor management
- Kit to Stock/Kit to Order
- Cartonization
- Slotting
- 3PL billing
- Value added services
- Voice picking
- Yard management

This intelligence powers performance. There is a single point of truth about product and resources from inbound processing to storage to outbound processing. It enables the monitoring and analysis of operations for improved planning and scheduling that leads to better execution.

Expert Assistance at Every Stage

Selecting the right solution for your operations isn't always easy. You have a choice between S/4HANA's Basic or Advanced options. It provides the opportunity to have one system for your supply chain needs.

We can help guide you through the selection process, so you have the appropriate system for current needs and scalability for future expansions. Our method is simple. We listen to your challenges and then support you through a customized plan from:

- Design
- Deployment
- Program Management
